

Aluminium Balustrades

A NIKA Balustrade system provides versatile possibilities for implementing impressive facades with unique personalities.

The aluminium balustrades are durable and easily maintained. They function well as an independent railing solution or together with a NIKA Balcony glazing in the differently-shaped balconies of multi-storey and private homes. The cladding material can be selected from various sorts of laminated glass, building boards

and tin plates. Depending on the site, the cladding material can be placed to either the inside or the outside of the railing posts. The appearance of the railings can be modified in numerous ways to meet the wishes of the designer.

Structure

A NIKA Balustrade system contains vertical posts, handrails and various frame profiles, with which the railing cladding is attached.

The material of the balustrade is aluminium, which is painted with a facade polyester coating. The colour of the balustrade is available in all RAL colour shades. The balustrade is dimensionally accurate and durable. It is rated to also withstand the additional load caused by a future installation of balcony glazing. A Nika Balustrade system is a whole entity, which contains design, dimensioning of the structures, production and installation.
